

BioCarbon Partners (BCP) is an African-headquartered and majority African-owned social enterprise that develops and manages long-term forest carbon projects in globally biodiversity significant landscapes in Africa. Our goal is to maximize the benefits of African forests within Africa. We believe that Africa has the talent and capacity to be a global leader in the Reducing Emissions from Deforestation and Degradation (REDD) sector.

BioCarbon Partners is a social enterprise. Our mission puts poverty reduction and conservation first, but in a financially sustainable way. Our hybrid business model includes an efficient, lean commercial structure to sell and market credits, and a grassroots model that targets social and environmental impact at a community level.

#### **Our MISSION:**

To forge global partnerships in order to reduce poverty, and enhance conservation through global carbon markets.

#### **Our VISION:**

To achieve transformational social development and conservation returns in Africa through REDD

Please feel free to contact us with any questions or concerns.

## **REDD+ BACKGROUND INFORMATION**

***PACHIYAMBI CHA REDD+***

## What is Climate Change

Since the late 19<sup>th</sup> century, average global temperatures of the Earth's atmosphere and oceans have been rising—and they are expected to continue to do so. Since the early 20<sup>th</sup> century, Earth's average surface temperature has increased by about 0.8 °C, with about two thirds of the increase occurring since 1980. This phenomenon is often referred to “**global warming**,” although the worldwide effects of global climate change have more varied than simply rising temperatures. Rising average global temperatures have resulted in less predictable and more extreme weather patterns—for example, unpredictable rainfall patterns, droughts, and extreme storms. These processes of global warming and climate change are caused by increasing concentrations of **greenhouse gases** produced by human **activities** such as **deforestation and the burning of fossil fuels** for energy transport and factories.

## What is REDD+

**REDD+** stands for Reducing Emissions from Deforestation and forest Degradation, and includes the conservation of indigenous forests, sustainable management of forests, and enhancement of forest carbon stocks.

Deforestation and forest degradation contribute approximately 20% of global anthropogenic greenhouse gas emissions. The United Nations Framework Convention on Climate Change (UNFCCC) is developing the REDD+ mechanism to provide financial incentives to reduce such emissions, in an effort to mitigate the effects of global climate change.

Zambia has about 50 million hectares of forest, with an estimated deforestation rate of 250,000 to 300,000 hectares annually. Primary drivers of deforestation and forest degradation need to be addressed in order to ensure the success of REDD+ projects in Zambia. Within Zambia these drivers vary across regions and include charcoal and wood fuel use, timber production, and unsustainable agriculture methods. Drivers of deforestation and forest degradation are influenced by a complex set of underlying causes that are primarily the result of past and current development processes. For a REDD+ project to be successful in Zambia, both the supply and demand for wood and non-wood forest products must be simultaneously addressed.

To ensure the success of REDD+ projects, interventions such as widespread knowledge about REDD+ and the development of incentives to adopt alternative livelihoods and energy sources are necessary. The success of REDD+ projects also depends on the large-scale engagement of stakeholders at all levels, but specifically at the community level, in order to ensure that communities receive tangible benefits from REDD+.

## What is a REDD+ Project

BioCarbon Partners (BCP) enters into partnerships with landowners, governments and local communities to protect naturally forested landscapes in order to reduce deforestation, provide sustainable development solutions to local communities, and to conserve biodiversity.

- BCP seeks partnerships with governments and landowners in areas of conservation importance
- BCP seeks partnerships with local communities in and around these forested areas
- BCP invests in land management, community development projects and carbon verification
- **BCP does not work on plantations, nor seek title to land, nor forcibly displace anyone. Our mantra is ‘socially responsible avoided deforestation’ achieved through partnership.**
