

CFP Site Selection Process: Viability Assessment Process

CFP Site Selection Process: General Overview

1. Initial Viability Assessment Process:

1. GIS Forest Cover Assessment
 2. Initial “High Level” Stakeholder consultations and documented consent (Letters of Support for Viability Assessment Process to continue)
 3. Initial Stakeholder and Forest Use Mapping (including stakeholder identification)
 4. Key Partners Formal Consultations
- Completion of Initial Viability Assessment (Tool)

2. FPIC Viability Assessment Process:

Consultation with majority (75% target) of community stakeholders
→ Documented consent following FPIC process

3. Forest Viability Assessment (“groundtruthing”): Identification of Viable Forest Areas

Key Viability Criteria:

1. INTACT FOREST

- Carbon content (forest cover type and quantity)
- REDD+ methodology criteria; e.g.: perimeter; proximity to threat; threat (etc)

2. COMMUNITY CONSENT to agree to protect this area long-term (30+ years)

NOTES ON PROJECT DESIGN:

- This project **IS** designed to **empower local communities and stakeholders as owners and beneficiaries of their natural resources** (ie: forests)
- This project **IS** designed to **promote long-term sustainable management of forests** and other natural resources, to ensure ongoing benefits over time (as opposed to short-term depletion), so that these resources continue to benefit future generations
- This project is **NOT** designed to displace anyone, or to restrict / remove current access or land-use rights
- **Stakeholders have the power to choose:** Community stakeholders have the right to say “no”; if communities do not / cannot agree to protect an area in the long-term, it should not be included in the project

4. Final Viability Assessment Process:

1. Is a **VIALE FOREST AREA** available?
2. Do **LOCAL COMMUNITIES CONSENT** to protecting these areas long-term?
3. Are other local stakeholders and partners (including local government) committed to supporting this project, and helping it to succeed?
4. Are systems in place to effectively manage and support the project?

→ **IDENTIFICATION OF VIALE REDD+ PROJECT**

REDD+ PROJECT IMPLEMENTATION

GOVERNANCE:

Engagement with local institutions; capacity-building support

LIVELIHOODS:

Identification of viable community based deforestation-mitigation activities, and involvement of supporting partners

FOREST MANAGEMENT

Involvement of local community members in forest protection, monitoring and enforcement

VERIFICATION

Completion of verification calculations, documentation, processes → Audit process

MARKET CREATION

BCP is committed to helping to create a market to support the ongoing sustainability of these projects.
